

POOL – SALT WATER SYSTEM

CLEANING YOUR SALT WATER CELL

THE FOLLOWING INFORMATION IS EXTREMELY IMPORTANT FOR THE SAFE MAINTENANCE OF YOUR SALT WATER POOL. PLEASE KEEP THIS INFORMATION ON HAND FOR FUTURE REFERENCE.

CELL CLEANING:

Salt Cells include a self-cleaning feature to prevent scale deposits on the graphite electrodes. However, deposits may still form due to unbalanced water conditions. If that happens the cell should be cleaned in an acidic solution.

To clean the cell, follow these steps:

- Wear eye protection and rubber gloves during these operations. Splashing or spilling acid can cause severe personal injuries and/or property damage. Always work in a well-ventilated area.
- All power must be disconnected before any service procedure is performed. Disconnect the communication cable and power cable of the unit.
- Always add acid to the water; never add water to the acid. Do not pour acid outside of the unit where the connectors are located.
- Never use Acetic Acid to clean the cell, may cause permanent damage to cell components and void the warranty.
- To remove scales from the cell, we recommend using Phosphoric acid (non-diluted) as the preferred cleaning product. Muriatic acid can be used as a second choice.
- If you use Muriatic acid, mix 900mL (1 quart) of muriatic acid with 3.78 liters (1 U.S. gallon) of tap water.
- Close the Flow Shut Off Valves. Unscrew both unions from the unit and remove the cell from the pool equipment compartment

- Install the rubber washer and the plastic nut on the threaded end of the cell. Tighten plastic nut firmly.
- Place the cell vertically with the cap end down into a plastic 19 liters (5 U.S. gallon) bucket and carefully pour the acid solution into the cell until the 4 plates are covered (careful not to overflow). The acid solution will begin to produce bubbles to clean the electrodes. A foaming action will follow, which is caused by the scale deposits being dissolved from the plates. If rigorous foaming action does not begin, the cell does not need to be cleaned. Rinse and reinstall the cell.
- Allow the electrodes to remain in the solution until the foaming has stopped. However, DO NOT leave it in the acid for more than fifteen minutes. Excessive acid cleaning will damage the electrolytic cell.
- Pour the acid solution back into the bucket and rinse the cell thoroughly with clean tap water. If deposits are still visible, repeat operation for fifteen minutes maximum (some acid may need to be added to the solution).
- Remove the plastic nut and washer from the cell and keep them for future cell cleaning.
- Rinse the cell with fresh water.
- Re-install the cell unit into pool system plumbing, tighten all connections by hand. Open the pool Flow Shut Off Valves.
- Reconnect the communication cable and power cable to the unit.
- Turn power on and start up the pump. Check the keypad to see that the chlorine generation LED is on and resume normal operation.
